

# CHORDS AND ARCS

*In this unit, students will learn*

- ✎ *If two arcs of a circle (or of congruent circles) are congruent, then the corresponding chords are equal.*
- ✎ *If two chords of a circle (or of congruent circles) are equal, then their corresponding arcs (minor, major or semi-circular) are congruent.*
- ✎ *Equal chords of a circle (or of congruent circles) subtend equal angles at the centre (at the corresponding centres).*
- ✎ *If the angles subtended by two chords of a circle (or congruent circles) at the centre (corresponding centres) are equal, the chords are equal.*

## THEOREM 1

**11.1(i)** If two arcs of a circle (or of congruent circles) are congruent then the corresponding chords are equal.

**Given:**  $ABCD$  and  $A'B'C'D'$  are two congruent circles

with centres  $O$  and  $O'$  respectively. So that  $m\widehat{ADC} = m\widehat{A'D'C'}$

**To prove:**  $m\overline{AC} = m\overline{A'C'}$

**Construction:** Join  $O$  with  $A$ ,  $O$  with  $C$ ,  $O'$  with  $A'$  and  $O'$  with  $C'$ .

So that we can form  $\Delta^s OAC$  and  $O'A'C'$ .

**Proof:**

Statements	Reasons
In two equal circles $ABCD$ and $A'B'C'D'$ with centres $O$ and $O'$ respectively.	Given
$m\widehat{ADC} = m\widehat{A'D'C'}$	Given
$\therefore m\angle AOC = m\angle A'O'C'$	Central angles subtended by equal arcs of the equal circles.
Now in $\Delta AOC \leftrightarrow \Delta A'O'C'$	
$m\overline{OA} = m\overline{O'A'}$	Radii of equal circles
$m\angle AOC = m\angle A'O'C'$	Already Proved
$m\overline{OC} = m\overline{O'C'}$	Radii of equal circles
$\therefore \Delta AOC \cong \Delta A'O'C'$	S.A.S $\cong$ S.A.S
and in particular $m\overline{AC} = m\overline{A'C'}$	
Similarly we can prove the theorem in the same circle.	

## THEOREM 2

### Converse of Theorem 1

**11.1(ii) If two chords of a circle (or of congruent circles) are equal, then their corresponding arcs (minor, major or semi-circular) are congruent. In equal circles or in the same circle, if two chords are equal, they cut off equal arcs.**

**Given:** ABCD and A'B'C'D' are two congruent circles with centres O and O' respectively.

So that chord  $m\overline{AC} = m\overline{A'C'}$ .

**To prove:**  $m\widehat{ADC} = m\widehat{A'D'C'}$

**Construction:** Join O with A, O with C, O' with A' and O' with C'.

**Proof:**

Statements	Reasons
In $\triangle AOC \leftrightarrow \triangle A'O'C'$	
$m\overline{OA} = m\overline{O'A'}$	Radii of equal circles
$m\overline{OC} = m\overline{O'C'}$	Radii of equal circles
$m\overline{AC} = m\overline{A'C'}$	Given
$\therefore \triangle AOC \cong \triangle A'O'C'$	S.S.S $\cong$ S.S.S
$\Rightarrow m\angle AOC = m\angle A'O'C'$	
Hence $m\widehat{ADC} = m\widehat{A'D'C'}$	Arcs corresponding to equal central angles.

**Example 1:** A point  $P$  on the circumference is equidistant from the radii  $\overline{OA}$  and  $\overline{OB}$ .

Prove that  $m\widehat{AP} = m\widehat{BP}$

**Given:**  $AB$  is the chord of a circle with centre  $O$ . Point  $P$  on the circumference of the circle is equidistant from the radii  $\overline{OA}$  and  $\overline{OB}$  so that  $m\overline{PR} = m\overline{PS}$ .

**To prove:**  $m\widehat{AP} = m\widehat{BP}$

**Construction:** Join  $O$  with  $P$ . Write  $\angle 1$  and  $\angle 2$  as shown in the figure.

**Proof:**

Statements	Reasons
In $\angle rt \Delta OPR$ and $\angle rt \Delta OPS$	
$m\overline{OP} = m\overline{OP}$	Common
$m\overline{PR} = m\overline{PS}$	Point $P$ is equidistance from radii (Given)
$\therefore \Delta OPR \cong \Delta OPS$	(In $\angle rt \Delta^s$ H.S $\cong$ H.S)
So $m\angle 1 = m\angle 2$	Central angles of a circle
$\Rightarrow$ Chord $AP \cong$ Chord $BP$	
Hence $m\widehat{AP} = m\widehat{BP}$	Arcs corresponding to equal chords in a circle.

### THEOREM 3

11.1(iii) Equal chords of a circle (or of congruent circles) subtend equal angles at the centre (at the corresponding centres).

**Given:**  $ABC$  and  $A'B'C'$  are two congruent circles with centres  $O$  and  $O'$  respectively.

So that  $\overline{AC} = \overline{A'C'}$

**To prove:**  $\angle AOC \cong \angle A'O'C'$

**Construction:** Let if possible  $m\angle AOC \neq m\angle A'O'C'$  then consider  $\angle AOC \cong \angle A'O'D'$

**Proof:**

Statements	Reasons
$\angle AOC \cong \angle A'O'D'$	Construction
$\therefore \widehat{AC} \cong \widehat{A'D'}$ (i)	Arcs subtended by equal Central angles in congruent circles
$m\widehat{AC} = m\widehat{A'D'}$ (ii)	Using Theorem 1
But $m\widehat{AC} = m\widehat{A'C'}$ (iii)	Given
$\therefore m\widehat{A'C'} = m\widehat{A'D'}$	Using (ii) and (iii)
Which is only possible, if $C'$ coincides with $D'$ .	
Hence $m\angle A'O'C' = m\angle A'O'D'$ (iv)	
But $m\angle AOC = m\angle A'O'D'$ (v)	Construction
$\Rightarrow m\angle AOC = m\angle A'O'C'$	Using (iv) and (v)

**Corollary 1.** In congruent circles or in the same circle, if central angles are equal then corresponding sectors are equal.

**Corollary 2.** In congruent circles or in the same circle, unequal arcs will subtend unequal central angles.

**Example 1:** The internal bisector of a central angle in a circle bisects an arc on which it stands.

**Solution:** In a circle with centre  $O$ .  $\overline{OP}$  is an internal bisector of central angle  $AOB$ .

**To prove:**  $\widehat{AP} \cong \widehat{BP}$

**Construction:** Draw  $\overline{AP}$  and  $\overline{BP}$ , then write  $\angle 1$  and  $\angle 2$  as shown in the figure.

**Proof:**

Statements	Reasons
In $\triangle OAP \leftrightarrow \triangle OBP$	
$m\overline{OA} = m\overline{OB}$	Radii of the same circle
$m\angle 1 = m\angle 2$	Given $\overline{OP}$ as an angle bisector of $\angle AOB$
and $m\overline{OP} = m\overline{OP}$	Common
	(S.A.S $\cong$ S.A.S)

$\triangle OAP \cong \triangle OBP$ <p>Hence <math>\overline{AP} \cong \overline{BP}</math></p> $\Rightarrow \widehat{AP} \cong \widehat{BP}$	Arcs corresponding to equal chords in a circle.
---	---

**Example 2:** In a circle if any pair of diameters are  $\perp$  to each other then the lines joining its ends in order, form a square.

**Given:**  $\overline{AC}$  and  $\overline{BD}$  are two perpendicular diameters of a circle with centre  $O$ . So  $ABCD$  is a quadrilateral.

**To prove:**  $ABCD$  is a square

**Construction:** Write  $\angle 1, \angle 2, \angle 3, \angle 4, \angle 5$  and  $\angle 6$  as shown in the figure.

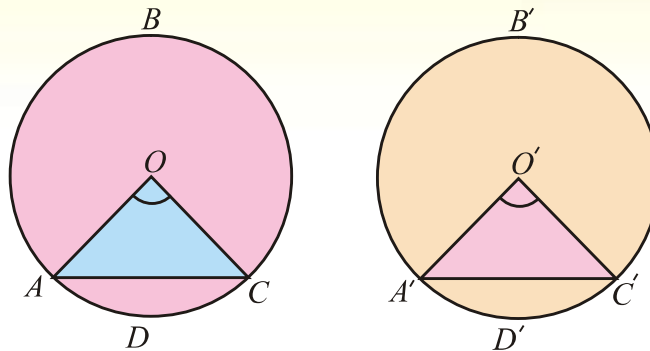

**Proof:**

Statements	Reasons
$\overline{AC}$ and $\overline{BD}$ are two $\perp$ diameters of a circle with centre $O$	Given
$\therefore m\angle 1 = m\angle 2 = m\angle 3 = m\angle 4 = 90^\circ$	Pair of diameters are $\perp$ to each other.
$\therefore m\widehat{AB} = m\widehat{BC} = m\widehat{CD} = m\widehat{DA}$	Arcs opposite to the equal central angles in a circle.
$\Rightarrow m\overline{AB} = m\overline{BC} = m\overline{CD} = m\overline{DA}$ (i)	Chords corresponding to equal arcs.
Moreover $m\angle A = m\angle 5 + m\angle 6$ $= 45^\circ + 45^\circ = 90^\circ$ (ii)	
Similarly $m\angle B = m\angle C = m\angle D = 90^\circ$ (iii)	
Hence $ABCD$ is a square	Using (i), (ii) and (iii).

## THEOREM 4

**11.1(iv)** If the angles subtended by two chords of a circle (or congruent circles) at the centre (corresponding centres) are equal, the chords are equal.

**Given:**  $ABCD$  and  $A'B'C'D'$  are two congruent circles with centres

$O$  and  $O'$  respectively.  $\overline{AC}$  and  $\overline{A'C'}$  are chords of circles  $ABCD$  and  $A'B'C'D'$  respectively and  $m\angle AOC = m\angle A'O'C'$

**To prove:**  $m\overline{AC} = m\overline{A'C'}$

**Proof:**

Statements	Reasons
In $\triangle OAC \leftrightarrow \triangle O'A'C'$	
$m\overline{OA} = m\overline{O'A'}$	Radii of congruent circles
$m\angle AOC = m\angle A'O'C'$	Given
$m\overline{OC} = m\overline{O'C'}$	Radii of congruent circles
$\therefore \triangle OAC \cong \triangle O'A'C'$	SAS $\cong$ SAS
Hence $m\overline{AC} = m\overline{A'C'}$	

## EXERCISE 11.1

1. In a circle two equal diameters  $\overline{AB}$  and  $\overline{CD}$  intersect each other.  
Prove that  $m \overline{AD} = m \overline{BC}$ .
2. In a circle prove that the arcs between two parallel and equal chords are equal.
3. Give a geometric proof that a pair of bisecting chords are the diameters of a circle.
4. If  $C$  is the mid point of an arc  $ACB$  in a circle with centre  $O$ . Show that line segment  $OC$  bisects the chord  $AB$ .

## MISCELLANEOUS EXERCISE 11

### 1. Multiple Choice Questions

Four possible answers are given for the following questions.

Tick (✓) the correct answer.

- (i) A 4 cm long chord subtends a central angle of  $60^\circ$ . The radial segment of this circle is:  
(a) 1                      (b) 2                      (c) 3                      (d) 4
- (ii) The length of a chord and the radial segment of a circle are congruent, the central angle made by the chord will be:  
(a)  $30^\circ$                       (b)  $45^\circ$                       (c)  $60^\circ$                       (d)  $75^\circ$
- (iii) Out of two congruent arcs of a circle, if one arc makes a central angle of  $30^\circ$  then the other arc will subtend the central angle of:  
(a)  $15^\circ$                       (b)  $30^\circ$                       (c)  $45^\circ$                       (d)  $60^\circ$
- (iv) An arc subtends a central angle of  $40^\circ$  then the corresponding chord will subtend a central angle of:  
(a)  $20^\circ$                       (b)  $40^\circ$                       (c)  $60^\circ$                       (d)  $80^\circ$
- (v) A pair of chords of a circle subtending two congruent central angles is:  
(a) congruent                      (b) incongruent                      (c) over lapping                      (d) parallel
- (vi) If an arc of a circle subtends a central angle of  $60^\circ$ , then the corresponding chord of the arc will make the central angle of:  
(a)  $20^\circ$                       (b)  $40^\circ$                       (c)  $60^\circ$                       (d)  $80^\circ$
- (vii) The semi circumference and the diameter of a circle both subtend a central angle of:  
(a)  $90^\circ$                       (b)  $180^\circ$                       (c)  $270^\circ$                       (d)  $360^\circ$
- (viii) The chord length of a circle subtending a central angle of  $180^\circ$  is always:  
(a) less than radial segment                      (b) equal to the radial segment  
(c) double of the radial segment                      (d) none of these
- (ix) If a chord of a circle subtends a central angle of  $60^\circ$ , then the length of the chord and the radial segment are:  
(a) congruent                      (b) incongruent                      (c) parallel                      (d) perpendicular
- (x) The arcs opposite to incongruent central angles of a circle arc always:  
(a) congruent                      (b) incongruent                      (c) parallel                      (d) perpendicular

## SUMMARY

- The boundary traced by a moving point in a circle is called its **circumference** whereas any portion of the circumference will be known as an arc of the circle.
- The straight line joining any two points of the circumference is **called** a chord of the circle.
- The portion of a circle bounded by an arc and a chord is known as the **segment** of a circle.
- The circular region bounded by an arc of a circle and its two corresponding radial segments is called a **sector** of the circle.
- A straight line, drawn from the centre of a circle bisecting a chord is perpendicular to the chord and conversely perpendicular drawn from the centre of a circle on a chord, bisects it.
- If two arcs of a circle (or of congruent circles) are congruent, then the corresponding chords are equal.
- If two chords of a circle (or of congruent circles) are equal, then their corresponding arcs (minor, major or semi-circular) are congruent.
- Equal chords of a circle (or of congruent circles) subtend equal angles at the centre (at the corresponding centres).
- If the angles subtended by two chords of a circle (or congruent circles) at the centre (corresponding centres) are equal, the chords are equal.
